

Assignment -4
Python Programming

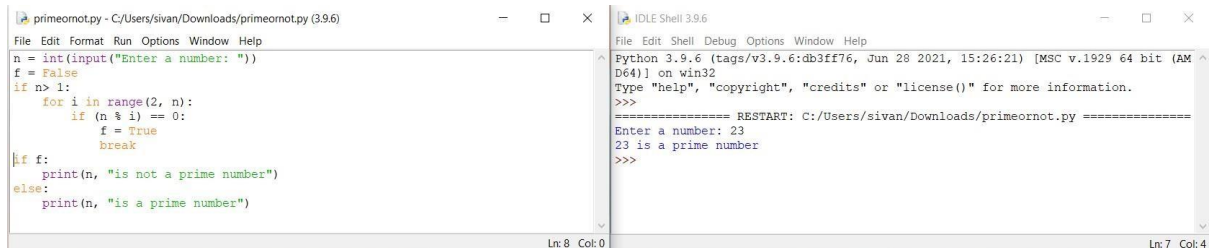

Assignment Date	19 September 2022
Student Name	Tharun Kumar C
Team ID	PNT2022TMID00767
Maximum Marks	2 Marks

Question-1:

Write a python program to test a given number is prime or not.

Solution :

```
n = int(input("Enter a
number: "))
f = False
if n > 1:
    for i in range(2, n):
        if (n % i) == 0:
            f = True
            break
if f:
    print(n, "is not a prime
number")
else:
    print(n, "is a prime
number")
```

The screenshot shows a Python IDE with two windows. The left window, titled 'primeornot.py - C:/Users/sivan/Downloads/primeornot.py (3.9.6)', contains the following code:

```
n = int(input("Enter a number: "))
f = False
if n > 1:
    for i in range(2, n):
        if (n % i) == 0:
            f = True
            break
if f:
    print(n, "is not a prime number")
else:
    print(n, "is a prime number")
```

The right window, titled 'IDLE Shell 3.9.6', shows the execution output:

```
Python 3.9.6 (tags/v3.9.6:db3ff76, Jun 28 2021, 15:26:21) [MSC v.1929 64 bit (AMD64)] on win32
Type "help", "copyright", "credits" or "license()" for more information.
>>>
===== RESTART: C:/Users/sivan/Downloads/primeornot.py =====
Enter a number: 23
23 is a prime number
>>>
```

Question-2:

Write a program to generate odd numbers from m to n using while loop

Solution :

```
min = int(input(" Enter any min value:"))
max = int(input(" Enter any max Value : "))
X=1;
if (min < max):
```

```

while X in range(min,max+ 1):
    if( X % 2 != 0):
        print("{0}".format(X))
        X=X+1;
else:
    print("min value you've entered is greater than max value")

```

The screenshot shows the Python IDLE Shell interface. The left pane displays the source code for 'odd.py', which prompts the user for a minimum and maximum value, then prints odd numbers in that range. The right pane shows the execution output, where the user entered 1 for the minimum and 5 for the maximum, resulting in the output: 1, 3, 5.

```

odd.py - C:\Users\sivan\Downloads\odd.py (3.9.6)
File Edit Format Run Options Window Help
min = int(input(" Enter any min value:"))
max = int(input(" Enter any max Value : "))
X=1;
if (min < max):
    while X in range(min,max+ 1):
        if( X % 2 != 0):
            print("{0}".format(X))
            X=X+1;
else:
    print("min value you've entered is greater than max value")
Ln: 1 Col: 0

5
>>>
Ln: 10 Col: 4

```

Question-3:

Write a Python program to display prime number series upto given number.

Solution :

```

l = 1
u = int(input("Enter the number : "))
print("Prime numbers between",l,"and",u,"are:")
for n in range(l,u + 1):
    if n > 1:
        for i in range(2, n):
            if (n%i) == 0:
                break
        else:
            print(n)

```

The screenshot shows the Python IDLE Shell interface. The left pane displays the source code for 'primenumberrange.py', which prompts the user for a number and prints all prime numbers between 1 and that number. The right pane shows the execution output, where the user entered 10, resulting in the output: Prime numbers between 1 and 10 are: 2, 3, 5, 7.

```

primenumberrange.py - C:\Users\sivan\Downloads\primenumberrange.py (3.9.6)
File Edit Format Run Options Window Help
l = 1
u = int(input("Enter the number : "))
print("Prime numbers between",l,"and",u,"are:")
for n in range(l,u + 1):
    if n > 1:
        for i in range(2, n):
            if (n%i) == 0:
                break
        else:
            print(n)
Ln: 10 Col: 11

Enter the number : 10
Prime numbers between 1 and 10 are:
2
3
5
7
>>>
Ln: 11 Col: 4

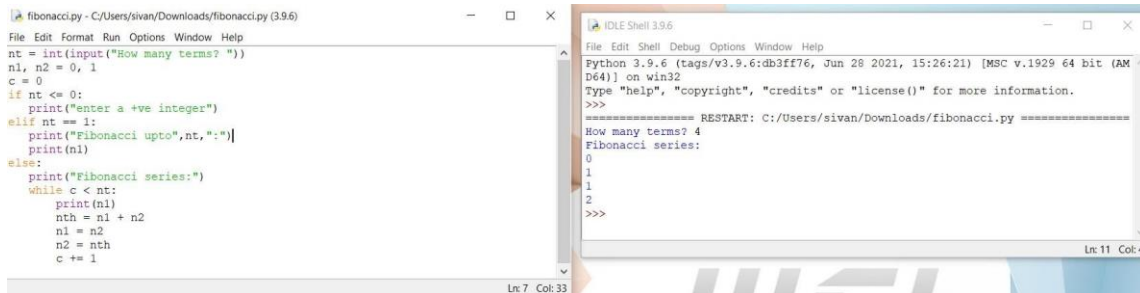

```

Question-4:

Write a Python program to generate Fibonacci series.

Solution :

```
nt = int(input("How many terms? "))
n1, n2 = 0, 1
c = 0
if nt <= 0:
    print("enter a +ve integer")
elif nt == 1:
    print("Fibonacci upto",nt,":")
    print(n1)
else:
    print("Fibonacci series:")
    while c < nt:
        print(n1)
        nth = n1 + n2
        n1 = n2
        n2 = nth
        c += 1
```

The screenshot displays two windows from a Python IDE. The left window, titled 'fibonacci.py - C:/Users/sivan/Downloads/fibonacci.py (3.9.6)', shows the source code of the program. The right window, titled 'IDLE Shell 3.9.6', shows the execution output. The user has entered '4' for the number of terms, and the program has printed the first four terms of the Fibonacci series: 0, 1, 1, 2.

```
fibonacci.py - C:/Users/sivan/Downloads/fibonacci.py (3.9.6)
File Edit Format Run Options Window Help
nt = int(input("How many terms? "))
n1, n2 = 0, 1
c = 0
if nt <= 0:
    print("enter a +ve integer")
elif nt == 1:
    print("Fibonacci upto",nt,":")
    print(n1)
else:
    print("Fibonacci series:")
    while c < nt:
        print(n1)
        nth = n1 + n2
        n1 = n2
        n2 = nth
        c += 1
